

## Create bootable USB flash drive

# Linux

### Dd utility

The easiest way. It is recommended to record in this way.

#### Attention

This will destroy all data on your USB drive!

#### Hint

You can find out the path to the USB device by running the command `lsblk`. Make sure it is not mounted.

```
dd bs = 4M if = / image.iso of = / dev / sd [x]
```

image.iso- the path to the image, `/dev/sd[x]` - the path to the USB device. Use exactly the path `/dev/sdx`, not `/dev/sdx1`

#### Attention

Be careful when specifying a USB device. The utility dd will not ask questions.
